Residential Garage Heaters

Air Intake and Exhaust

The flue gas of the radiant tube is disposed of through an exhaust system to the outside. The combustion air can be taken either the inside of the building, or ducted in from the outside through an air intake system.

Radiant Tube Heater Construction

We use only the highest quality North American made components and materials in our products. The combustion tubes consist of aluminized or galvalume steel that withstand high temperatures and are corrosion resistant, providing additional durability. The tubes go through a high temperature surface coating treatment by which the radiant heat is increased. The radiation-optimized, highly polished reflector directs the radiant heat to the area where it is needed. The use of these high quality components results in increased performance, higher levels of comfort, and allows for greater fuel savings that have reached **50% or better**.

FEATURES:

- 40,000 BTU - Propane or Natural Gas
- Hot Surface ignition with Honeywell Self-Diagnostic SmartValve
- High radiant efficiency
- Totally enclosed burner
- Simple one man installation
- 24 Volt thermostat, hanging chain & exhaust vent cap included
- Designed for horizontal or angle mounting
- Pre wired burner with 3-prong plug for EZ 120 Volt wiring
- Approved for mounting as low as 7 ft. from the floor

Straight Model

- Dimensions:
- Overall Length: 22 ft.
 - Width: 12 inches
 - Height: 15 inches
 - 3.5" 16 gauge Steel tubing

U Shaped Model
